FOR BANKS

DMP
Digital Monitoring Products

Fifteen of North America's largest banks trust DMP. Shouldn't you?

SYSTEM UPDATES AND FEATURES ARE EASY TO UPLOAD

Meeting all the requirements of a true network device, a DMP system enables you to upload new programs and new features to flash ROM as soon as they are released. Your system can be updated remotely through your existing WAN by your service provider—a valuable design feature that eliminates costly service trips to each location for system updates.

PROGRAMMABLE RE-ARM TIMES ENSURE FOOLPROOF ARMING

Should a programmed area be left unprotected due to user error (e.g. forgetting to arm before leaving the premise), the area can be customized to automatically arm after a programmed time. Re-arm time can also be customized for each user profile, which is ideal for ATM kiosk areas, ATMs, and cash safes that are to be accessed only briefly.

FLEXIBLE AND SCALABLE ACCESS CONTROL

Our Entré Access & Security Management System gives you fast, simple, point-and-click control over every aspect of both your access control and security system. All management activities are combined in a single, high-functioning platform. As a network application, you can see and manage your facilities wherever they are located from anywhere you have an Internet connection.

FEATURES DESIGNED ESPECIALLY FOR BANK SECURITY

Reassuring panic/hold-up button summary test: The system can be placed in TEST mode to check proper operation of the Panic/Hold-up buttons without having to call the Central Station.

Wireless Systems: Wireless, hybrid, and wired systems are all available, and each has its own advantages. A key benefit of wireless devices is that they can be placed for optimum effectiveness with no need to drill holes or run wires. Our fully-supervised, UL Listed devices provide reliable protection, and are authorized for wireless commercial burglary and fire applications.

Two-Man rule: The Two-Man option can be enabled to require that two separate user codes be entered before the area will disarm or allow door access.

Early Morning Ambush: After entering their code, the first employee to arrive must also enter a second code within the programmed time or a SILENT AMBUSH message is transmitted.

Since 1975, DMP solutions have met the needs of financial institutions, their customers, and employees throughout North and South America.

DMP is the most trusted name in security for financial institutions—with more than tens of thousands of installations throughout North and South America. Sophistication and simple operation make DMP the best choice for integrated intrusion, fire, and access control for branches of all sizes. You can count on DMP to provide tested security solutions tailored to your needs.

We have earned the respect of financial institutions by gaining an intimate knowledge of the security issues they face—so our solutions are based on pressing real-world security threats, not generic system design formulas.

Compatibility preserves the lasting value of your security investment.

For over three decades, DMP has designed systems and user interfaces for backward and forward compatibility, always delivering cost-effective solutions scaled to fit your organization's needs. All DMP system software and hardware is designed for continuous improvement. We strive to maintain compatibility so you can take advantage of the newest technologies without the cost of replacing obsolete components.

FULL TIME NETWORK AND GSM MONITORING

The optional on-board encrypted network technology from DMP provides the most sophisticated solution for integrated intrusion and access control in the industry. Using on-board network, and DMP GSM Cellular or dialer backup connectivity with an existing full-time data network connection (LAN or WAN), can save you tens of thousands in phone line and long distance charges between your panel and Central Station. For fire systems, the DMP Digital Cellular Communicator is UL Listed as either a primary or slave communicator with no backup, creating additional savings on communications costs.

HIGHER STANDARDS MEAN BETTER SECURITY

DMP panels and receivers have earned the UL AA High Line listing for AES encryption and ULC Line Security Level V. Both our traditional SCS-1R Receiver and software-only SCS-VR Virtual Receiver are certified by the National Institute of Standards and Technology (NIST) for monitoring over TCP/IP networks, making DMP ideal for secure environments where encrypted data is required.

EASY TO USE, EASY TO MANAGE

10,000 User Codes: Each user is assigned to one of 99 different profiles that include access to any combination of 32 areas. Each profile is easily configured for the user's authority.

12,000-Event History Buffer—for evidence and evaluation: System events can be viewed at any keypad for quick evaluation. They can also be sent to a local printer or computer, and they can be retrieved by a Central Station.

READY TO MAKE A SECURE INVESTMENT?

- ▷ Easy-to-use keypads that simplify training and system operation
- ▷ Researched security solutions tailored to your institution's needs
- ▷ Tried and tested network monitoring that eliminates the cost of additional phone lines and long-distance charges
- ▷ Recurring cost-saving solutions via remote updates
- ▷ Reporting features that provide valuable data for security evaluation, event reporting, accountability, and evidence
- ▷ Hardware that is made in the USA for the highest quality and performance
- ▷ Open-architecture design that integrates easily with third-party applications for ease of systems integration

DMP systems are designed with employees and service providers in mind, so keypads are easy to operate, regardless of experience level.
